

Deep Dive: 1. Welcome to Python!

Concept Summary

Python is a high-level, interpreted programming language designed to be easy to read and simple to implement.

Coding Structure

```
print(data_to_display)
```

Example Code

```
print('Hello, World!')  
print(100)
```

Code Explanation

- Line 1: Uses the built-in print() function. The text 'Hello, World!' is a string, so it must be wrapped in quotes. It outputs the text to the console.
- Line 2: Prints the number 100. Numbers do not need quotes.

Practice Problems

1. Write a script that prints your first and last name on separate lines.
2. Print a simple shape (like a triangle) using multiple print statements.
