

Deep Dive: 7. Lists

Concept Summary

Lists are ordered, mutable (changeable) collections of items.

Coding Structure

```
my_list = [item1, item2]
my_list.append(new_item)
```

Example Code

```
fruits = ['apple', 'banana']
fruits.append('cherry')
fruits[0] = 'mango'
print(fruits)
```

Code Explanation

- Line 1: Creates a list with two string elements.
- Line 2: Uses the `append()` method to add 'cherry' to the very end of the list.
- Line 3: Modifies the list by replacing the item at index 0 ('apple') with 'mango'.
- Line 4: Prints the final list: ['mango', 'banana', 'cherry'].

Practice Problems

1. Create a list of 5 numbers, remove the last number using `pop()`, and print the list.
2. Sort a list of random names in alphabetical order using the `.sort()` method.
