

Deep Dive: 8. Tuples

Concept Summary

Tuples are ordered collections of items that are IMMUTABLE (they cannot be changed after creation).

Coding Structure

```
my_tuple = (item1, item2)
```

Example Code

```
dimensions = (1920, 1080)
width, height = dimensions
print(f'Width: {width}')
```

Code Explanation

- Line 1: Creates a tuple using parentheses. If you try to do `dimensions[0] = 800`, Python will crash with an error.
- Line 2: Demonstrates 'Tuple Unpacking'. It instantly splits the tuple's values into two separate variables: `width` and `height`.

Practice Problems

1. Create a tuple containing your birth year, month, and day. Unpack it into three variables.
2. Try to change the first item of your tuple. Observe the `TypeError`!
