

Deep Dive: 10. Sets

Concept Summary

Sets are unordered collections of UNIQUE elements. They automatically discard duplicates.

Coding Structure

```
my_set = {item1, item2}
```

Example Code

```
numbers = {1, 2, 2, 3, 3}
print(numbers)

a = {1, 2}
b = {2, 3}
print(a.intersection(b))
```

Code Explanation

- Line 1: Creates a set. Notice it uses curly braces like a dictionary, but has no key-value pairs.
- Line 2: Prints {1, 2, 3}. The duplicates were instantly destroyed.
- Line 6: Uses set math (intersection) to find elements that exist in BOTH set 'a' and set 'b'. It prints {2}.

Practice Problems

1. Create a list with duplicates, convert it to a set to remove them, then convert it back to a list.
2. Create two sets of friends. Use the .union() method to find all unique friends.
